-- A locked portal opening control system comprising:

an encryption device responsive to input of a structure identifier to encrypt an encrypting cryptographic key for a structure with a time representation to produce a cryptogram output;

a decryption device located at said structure and having an unlocking assembly coupled to said lock mechanism, said decryption device being responsive to input of said cryptogram to unlock said lock mechanism if a

decrypted time representation produced by decrypting said cryptogram meets a time-based criteria in said decryption device,

wherein,

said encryption device includes a first clock and an encryption algorithm;

said decryption device includes a second clock operating a fixed time relationship to said first clock, and a decryption algorithm corresponding to said encryption algorithm; and said decryption device decrypts said cryptogram to produce a decrypted time representation and compares said decrypted time representation against a time representation based upon a clock time of said second clock to cause said unlocking assembly to unlock said lock mechanism if the decrypted time representation meets said time-based criteria. --.
